

Wagenborg Nedlift

Wagenborg Nedlift offers a wide variety of vertical transport equipment and owns a modern and diverse fleet of over a hundred units. From single lifts using one hydraulic crane to complicated projects using a large variety of equipment.

Wagenborg Nedlift is using NTZ micro filtration on the engines of its cranes for over 15 years

Jan Winkels chief Technical Department:

We apply NTZ bypass filtration on the engines of our cranes since 1990. Nowadays we use a full synthetic oil, which normally needs to be replaced every 1000 hours. By applying a NTZ filter we have been able to stretch the oil change interval from 1000 to 2000 hours, thereby saving 2500 liters of engine oil and 50 man hours annually.

Next to these direct costs it also saves us a lot of problems for the planning department. Since we only need to change oil once a year we can maximize implementation of our equipment.

**NTF micro filtration
for maximum flexibility**
